submitted to the EMEL Data Library, September 1991
A. Poescription: A whole genome of hepatitis C virus cona was isolated from a single pa A. Reference number: $18038
A. Rocession: $18030
A. Mocelle type: genomic RNA
A. Residues: 1-3010 <4HONS
A. Cross-references: EMEL:X61596; NID:959478; PIDN:CAA43793.1; PID:959479

```
genome polyprotein - hepatitis C virus (strain HC-J8)
N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstreation Ns4a nonstructural protein NS4a; onstructural protein NS5
C; Species: hepatitis C virus
C; Species: hepatitis C virus
C; Date: 31-Dec-1992 #sequence_revision 31-Dec-1992 #text_change 19-Jan-2001
C; Accession: A40250; pp0397; pp0559

```
The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and Niver cancer. The present invention concerns a number of NS3 inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                                                                                                                                    Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C

Claim 26; Fig 14; 66pp; English.

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and Niver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both resential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and Niver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       100

These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify protease and protease:inhibitors complexes. The protein produced from this sequence contains the alpha-helixO wild-type sequence.

These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and Niver cancer. The present invention concerns a number of NS3 inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ProAlaProGlnGlySerArgSerLeuThrProCysThrCysGlySerSerAspLeuTyr 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the coding sequence for a mutated version of a

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-7 variant.

These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3 mytants fullon proteins which can be used to identify inhibitors of this type, as

œ

```
protease gene, useful for in vivo screening of compounds which inhibit HCV infection
pestivirus genome where the Npro protease gene is replaced with NS3
```

Example 2; Columns 17-28; 20pp; English.

Anti-viral synthetic prototoxophore associated DNA sequence.

chimeric Hepatitis C virus (HCV) pestivirus genome. The construct comprises a pestivirus genome where a Npro pestivirus protease gene is replaced with a gene encoding a functional HCV NS3 protease. Furthermore, each junction site recognised by the Npro protease is replaced with a junction site recognised by the HCV NS3 protease. The construct is useful for screening compounds that inhibit HCV in vivo by inhibiting HCV protease, where screening may be in cell culture or in an animal model. The present sequence is a chimmeric clone of BVDV (bovine viral diarrhea virus)/HCV NS3-wt, which was used to illustrate the present invention. present invention relates to a nucleic acid construct encoding a

This invention relates to a novel synthetic viral prototoxophore comprising a toxin molety operatively incorporated into a substrate domain specific for a viral enzyme. This prototoxophore may be bound and modified by the viral enzyme thus converting it to a toxophore. Also disclosed in the invention is a method for enhancing the anti-viral effect of an antiviral agent, this method comprises contacting a cell, infected with a virus or is susceptible to infection, with a prototoxophore. The invention further comprises an assay to identify anti-viral agents, comprising contacting an infected cell with a candidate agent and comparing the ability of the agent to inhibit the growth or infectivity of the virus in the cell. The prototoxophores of the invention may be useful for reducing or inhibiting viral infectivity, by contacting a cell (e.g. lymphocyte, nerve cell, connective tissue cell, muscle cell or hepatocyte) which is infected with a virus or is susceptible to infection with a virus, with a virus of its susceptible to infection with a virus, with a virus of the prototoxophore is also useful for ameliorating the severity of a viral infection in a subject, where the virus is selected from human immunodeficiency virus (Hist), herpes simplex virus (HSV), rhinovirus and hepatitis virus, by administering an effective amount of the prototoxophore to the subject. The prototoxophores of the invention are antiviral prototoxophore associated DNA sequence represents an antiviral prototoxophore associated DNA sequence. The prototoxophore is a necental DNA sequence, this sequence is a networthy and received by administering and prefer sequence represents an antiviral prototoxophore associated DNA sequence. The prototoxophore is a recombinant with NSJ/NS4 fusion protein in example 1 of

encodes antigens which react with antibodies in patients with non-A non-B hepatitis (NANBH). The CDNA can be used to design probes, or to synthesise polypeptides, which are used to diagnose HCV-induced NANBH, to raise antibodies for immnosasay or treatment, or to produce vaccines. It can be used to make oligomeric DNa hybridisation probes to detect the presence of HCV nucleic acids in samples. The polypeptide(s) it encodes could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis.

It can be used to make oligomeric DNA hybridisation probes to detect the presence of HCV nucleic acids in samples. The polypeptide(s) it encodes could be used as immunoassay reagents and vaccines and to generate antibodles useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence shows a composite hepatitis C virus (HCV) cDNA, derived by aligning clones k9-1 through 15e in 5'-3' direction. The cDNA encodes antigens which react with antibodies in patients with non-A non-B hepatitis (NANBH). The cDNA can be used to design probes, or to synthesise polypeptides, which are used to diagnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines. See also AAP9028B, and AAN90303-35.

(N.B. This record was resubmitted to correct errors in the sequence.) (Updated on 25-MAR-2003 to correct PR field.)
